

Eco Footprint Visualizer

The 4-Tier Analogy System

Application Concept

created by **Elena Lebedeva**

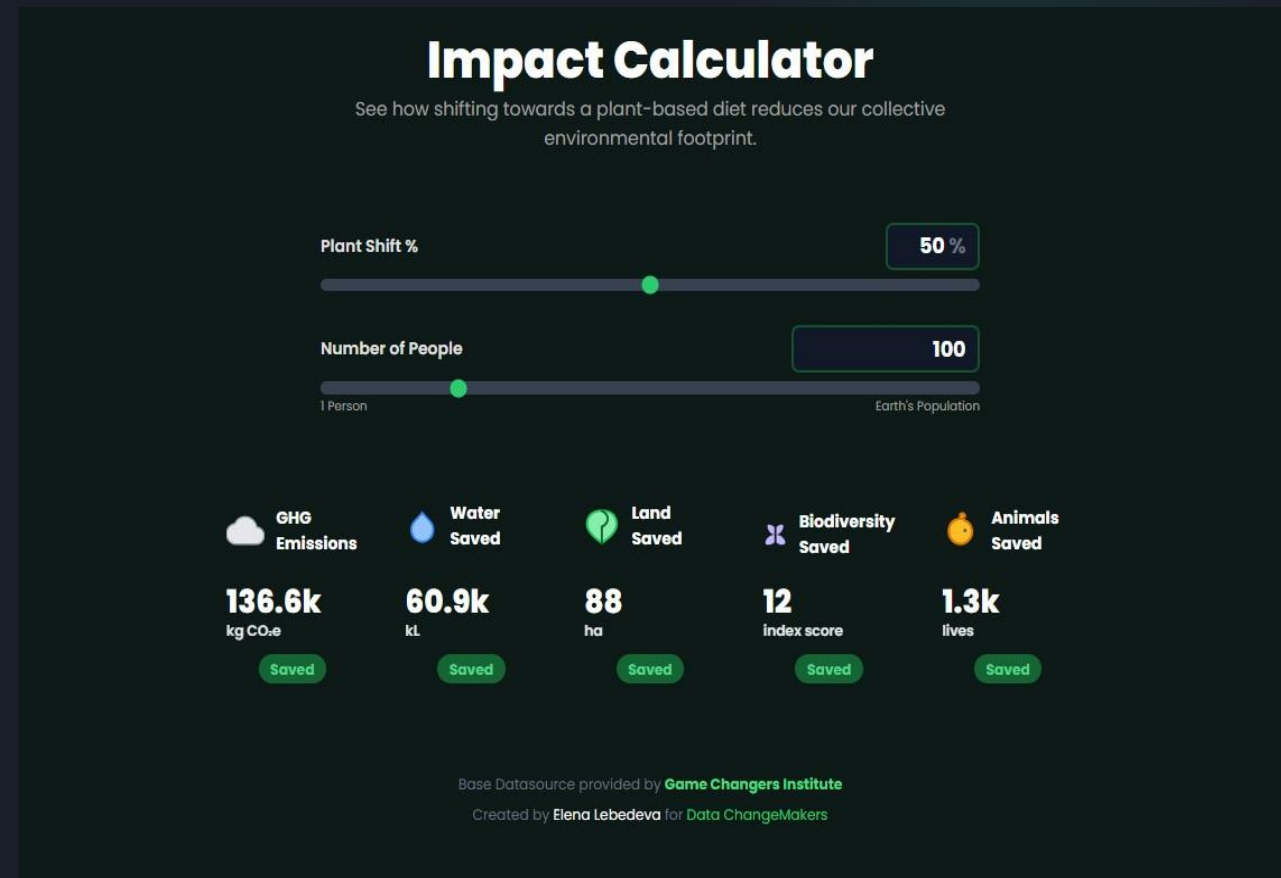

for Data ChangeMakers & **Game Changers Institute**

| App Overview: Visualizing Collective Impact

This interactive web application translates complex dietary impact data into tangible, relatable, real-world analogies.

It allows users to see how shifting towards a plant-based diet affects the planet at scales ranging from a single person to the entire global population (8.2 Billion).

Core Goal: To transform abstract environmental figures into powerful, motivating, and immediately graspable impact visualizations.

Five Core Impact Metrics

GHG Emissions Measured in kilograms of CO₂ equivalent

Water Saved Measured in kiloliters

Land Saved Measured in hectares

Biodiversity Saved A proxy index score representing species risk reduction.

Animals Saved Calculated as farmed animal lives spared based on consumption compensation factors.

| The Analogy System: Scaling Impact

Tiers 1 & 2: Personal to Urban

Focus on relatable, human-scale metrics. We start with individual actions and expand to urban landmarks to help users grasp the immediate value of their contribution.

Tiers 3 & 4: National to Global

Represent the aspirational collective impact. We use massive geographic features and entire nations/biomes to visualize what happens when millions of people act together.

GHG Emissions (Carbon) – Analogies

Tier 1 (Personal) Passenger Cars taken off the road for a year.

Tier 2 (Urban) Days of total vehicle emissions in New Delhi.

Tier 3 (International) Years of cancelling all Singapore-NYC flights.

Tier 4 (National) Months of grounding all US Domestic Flights.

Water Saved – Analogies

Tier 1 (Infrastructure) Olympic Swimming Pools.

Tier 2 (Urban Landmark) The volume of The Serpentine Lake (London).

Tier 3 (Country Landmark) The volume of Lake Balaton (Hungary)

Tier 4 (Geographic) The volume of Lake Titicaca (Andes).

Land Saved – Analogies

Tier 1 (Cultural) The area of the Louvre Museum complex (Paris).

Tier 2 (Mega-City) The area of Tokyo, Japan.

Tier 3 (Nation - Small) The area of Costa Rica.

Tier 4 (Nation - Large) The area of Mongolia.

Biodiversity – Analogies

Tier 1 (Urban Park) Biodiversity of Park Güell (Barcelona).

Tier 2 (City Region) Biodiversity of Cape Town (S. Africa).

Tier 3 (Island Nation) Biodiversity of Madagascar.

Tier 4 (Global Biome) Biodiversity of the entire Amazon Rainforest.

Animal Lives Saved – Analogies

Tier 1 (Direct Count) Individual Icons (Actual lives saved).

Tier 2 (Wild - Rare) Multiples of the Global Wild Panda Population.

Tier 3 (Wild - Common) Multiples of the Global Wild Horse Population.

Tier 4 (Domestic - Massive) Multiples of all Pet Cats & Dogs in the world.

System Summary Matrix

Category	Tier 1 (Small Scale)	Tier 4 (Massive Scale)
GHG Emissions	Passenger Cars (Annual)	All US Domestic Flights (Grounded)
Water Saved	Olympic Swimming Pools	Lake Titicaca (Andes)
Land Saved	Louvre Museum Complex	Mongolia (Nation Area)
Animal Lives	Farm Animals	Global Pet Cats & Dogs
Biodiversity	Park Güell (Barcelona)	Amazon Rainforest

Every Action Counts

"Visualizing impact transforms abstract numbers into tangible motivation."
